²Faculty Member, De La Salle – Lipa, Batangas

ABSTRACT

No country can live just on its own. Its survival depends on its valuable and productive dealings with other people and nations. Thus, global studies is deemed necessary to equip its citizens with necessary skills and knowledge to become global citizens of the world. In this context, the study aimed to determine how promotion of global education in Social Studies impacted students’ acquisition of global perspectives in the public secondary schools. Three hundred fifty-four students were chosen as respondents using simple random sampling technique. Results of the study showed that promotion of global education significantly relates to students’ acquisition of global perspectives. The teachers amply integrated global education in their lessons and that their students possessed global perspectives. Global education was an inherent and an important component of the Social Studies curriculum. Discussion of world problems, issues, and concerns enabled students to develop virtues of empathy, responsibility, and civic mindedness making them global citizens. The subject Social Studies sufficiently provided a setting for the students to develop global perspectives. As such, teachers are encouraged to further develop their own global perspectives, and urge students to get actively involved in civic and socially relevant activities. Furthermore, requesting students to provide solutions to world problems in classroom discussions will surely enhance their skills in problem solving and critical thinking in the context of global perspectives.

Global Education and Students’ Acquisition of Global Perspectives in Social Studies

Introduction

The world is interdependent. The survival and well-being of a country is intimately related to its ability to deal effectively with other people and nations. With a host of international issues, global studies can be viewed as basic education that students must learn as part of their Social Studies subject. Global education, therefore, is not just a study of a group of international concerns such as global warming, education for all (EFA), women emancipation, and free trade, but it promotes a change in the way one sees the world—a fundamental change of collective world view. Global education prepares students for the preservation of a sustainable environment, for the promotion of universal basic education, for the eradication of discrimination of marginalized sectors of the society, and for participation in a competitive economic world (Steinberg & Kincheloe, 2010).

A multitude of international education organizations have emphasized that comprehensive global education must be made a priority in the schools of all nations. The Organization for Economic Cooperation and Development (OECD, 2010) asserted that high levels of educational attainment and the ability to work effectively in a global context are the key indicators of a nation's potential for economic success in the future. The United Nations Educational, Social, and Cultural Organization (UNESCO, 2006) underscored the need for all countries to incorporate such global education concepts as sustainability education, education for human rights, and intercultural and interfaith education into their school curricula.

On these matters, Philippines is not far behind in rallying global education in its educational system. Legal mandates are instituted that primarily promote global education and global perspectives among Filipino youth. The 1987 Philippine Constitution, in particular, enunciates the essence of global perspectives when it states that educational institutions shall: “Inculcate patriotism and nationalism, foster love of humanity, respect for human rights...” (Art. XIV, Sec. 3, No. 2). In a more direct endorsement of global education, The Enhanced Basic Education Act of 2013 (Republic Act 10533) asserts that “...every graduate of basic education shall be an empowered individual who has learned, through a program that is rooted on... the competence to engage in work and be productive, the ability to coexist in fruitful harmony with local and global communities, ... and the capacity and willingness to transform others and one’s self (Sec. 2).”

Several Filipino educators have contributed to the promotion of global perspectives/global citizenship in the country. Among the earliest, Claudio (2015) cited Camilo Osias as one of them when he wrote “In the Filipino Way of Life (1940),” Osias revisited the link between peace and internationalism by speculating on the new global systems of governance that would create international solidarity. He articulated these views after the great war and repeated them amid the violent rise of the “Third Reich.” One of the current advocates, Loreta Navarro-Castro pioneered peace education research in the country and in her co-authored work entitled Peace Education: A Pathway to a Culture of Peace, she stated that “To meet effectively the challenges posed by the present complexity of our time, the young of today deserves a radically different education—one that does not glorify war but educates for peace, nonviolence and international cooperation.” Another advocate, Dr. Lourdes R. Quisumbing has contributed to the advancement of global education through her works promoting citizenship education among Filipino students (Quisumbing, 2002).

Students’ learning is not simply an understanding of each world issue but an awareness of the interconnections among these issues. Along with knowledge, the goals of global education are to increasingly emphasize values and attitudes. Its purpose is to develop in youth the knowledge, skills,
and attitudes needed to live effectively in a world possessing limited natural resources and characterized by ethnic diversity, cultural pluralism, and increasing interdependence, which pave the way toward the development of the students' global perspectives.

The best way to achieve a global perspective is through a learner-centered syllabus informed by the students' needs, their present understanding of global issues, and a clarification of their own values as espoused by OECD (2010). Values-oriented education seems best implemented by a learner-centered pedagogy that encourages students to take responsibility for their learning, to learn cooperatively in pairs and small groups, and to make connections between the classroom lesson and their own lives. Students are encouraged to clarify and express their values, to think and speak critically about world issues, and to judge and synthesize other perspectives.

While integration of global perspectives should occur across the curriculum, infusing these aims into the Social Studies course has become particularly imperative. Social Studies is a primary subject through which young people develop their civic identity (Avery, 2004). In fact, the National Council for the Social Studies (NCSS, 2010) defined Social Studies as “the integrated study of the social sciences and humanities to promote civic competence.” In today's world, civic competence requires the knowledge and dispositions embraced by global educators including a thorough understanding of world geography; national and international politics; the historical foundations of the modern world; intrapersonal understanding and intercultural and interpersonal skills (Rapoport, 2012).

The NCSS National Curriculum Standards of the United States (2010) claimed that “Social Studies programs should include experiences that provide for the study of culture and cultural diversity” and that they “should include experiences that provide for the study of global connections and interdependence.” In fact, culture in global connections are two of the 10 themes of Social Studies endorsed by the NCSS, that directly relate to the importance of global education in the Social Studies curricula. If students are to be successful in future global society, they will need to develop a truly global perspective. It is the responsibility of Social Studies educators to facilitate this growth through global education.

The researchers fully agree that Social Studies is the primary course wherein global education can be integrated. In conducting the current research, it will give teachers a deeper understanding of global education and how students can acquire global perspectives. The results of the investigation will likewise be of great help to others to be enlightened of the significance of acquiring personal global perspectives to enable them to be globally competitive in any field of specialization.

Framework of the Study

The current study is anchored on Critical Theory, developed by a group of writers and researchers connected to the Institute of Social Research at the University of Frankfurt (Steinberg & Kincheloe, 2010). It is a moral construct designed to reduce human suffering in the world and it asserts that every individual is granted dignity regardless of his or her location. Wood (2008) further explained that Critical Theory provides a framework for understanding and analyzing power relationships in society. It asks questions about injustice, inequality, and oppression that highlight the power imbalances in all societies. Educators taking critical theory perspectives decide whether educational practices address social justice and empowerment for oppressed persons. It explores the context (historical, political, economic, etc.) in which education systems evolved and exist as a way of understanding the nature and depth of inequity.
In seeking to understand how education reforms fomented by globalization, it is important to establish how both globalization and education reform are examined. Kellner (2000) described the link between critical theory and globalization. A critical theory of globalization attempts to specify the interconnections and interdependencies between different levels such as the economic, political, cultural, and psychological as well as between different flows of products, ideas and information, people, and technology. It analyzes both how globalization creates forces of domination and resistance and seeks and promotes strategies of resistance to the oppressive and exploitative aspects of globalization. The intent of critical theorists is to understand and reveal inequities to be able to constructively change society to make it more equitable.

Kellner (2003) viewed a critical theory of education as conceiving of what education could be, in how reforming education could help change society. The structures of education need to change dramatically to adjust to new global realities in the economy, technology, culture, etc. The reconstruction of education on the grounds that socio-economic, cultural, and the material conditions of everyday life and labor are changing is a reasonable response to the great transformations now underway. The authors call for a radical reconstruction and democratization of education. They assert that critical pedagogy must engage the difficult issue of overcoming differences, understanding cultures very dissimilar from one’s own and developing a more inclusive democracy that will incorporate marginalized groups and resolve conflicts between diverse groups and cultures.

In relation to the above-mentioned discussion, the promotion of global studies in Social Studies subject is a medium by which students acquire global perspectives. Figure 1 shows the framework of the study.

![Figure 1 Paradigm of the Study](image)

The study intends to determine the relationship of global education to students’ global perspectives. Thus, the researchers devised the independent-dependent variable model as the proper diagrammatic representation of the framework of the study.

The independent variable is a set of aspects of global education in the teaching of Social Studies which include interdependence among nations, world problems, environmental concerns, and global citizenship. The dependent variable involves the students’ acquisition of global perspectives along the dimensions of cognitive, intrapersonal and interpersonal domains.

- Cognitive Domain
- Intrapersonal Domain
- Interpersonal Domain

**Purposes of the Research**

This study focused on how the promotion of global education in the teaching of Social Studies is related to the students’ acquisition of global perspectives in the public secondary schools in a division in Batangas City during the academic year 2014-2015. Specifically, it sought answers to the following questions:

1. To what extent do Grade 9 students of the public secondary schools observe the promotion of global education in the teaching of Social Studies in the division in Batangas City in terms of interdependence among nations, world problems, environmental concerns, and global citizenship?
2. What is the level of agreement of the students on their acquisition of global perspectives in Social studies on the cognitive, intrapersonal, and interpersonal domains?

3. Is there a significant relationship in the promotion of global education and the students’ acquisition of global perspectives in Social Studies?

Methodology

Descriptive method established the relationship between global education and students’ acquisition of global perspectives. Using simple random sampling technique, 354 Grade 9 students from a total population of 3,114 were chosen as participants of the study from nine public secondary schools. The Slovin’s formula was utilized in establishing the sample size at 0.05 level of significance. The main data-gathering instrument was a questionnaire in which indicators were based on the global education survey constructed by Poole (2014) and the Global Perspectives Inventory (GPI) of Braskamp et al. (2013). The questionnaire was reworded to adapt it to the local setting with the assistance of several local education authorities. As to data analysis, simple mean and Pearson Product-Moment Correlation were utilized.

Results and Discussion

Social Studies is an important component to make the basic education of the students complete. It is here that their understanding of the Philippine society and the world gets deeper in the light of diversified cultures and traditions aside from different ways of looking at the issues that concerns the very survival of the human race. Respect for diversity, and at the same time, promotion of global perspectives are given consideration so that people from different countries can live in peace and in prosperity.

The advent of globalization and modern technology further enhance communication and transportation paving the way to a more globalized living. As an all-embracing contemporary phenomenon, according to Tullao (2003), globalization has affected almost all aspects of human life. With greater interdependence among nations, groups and individuals, wealth has been enhanced through global trade and investment but at the price of exposing vulnerable sectors to systematic risks and uncertainties. As globalization tries to integrate the global village, it simultaneously breaks down traditional institutions. It has brought about unequal consequences that even the efficiency gains are being challenged by sectors that are hurt by the conduct of liberalization and deregulation of the economy. The negative effects of globalization, not only on the productive sectors of the economy but also on environment, health, education and society as a whole, can no longer be ignored. This is one of the concerns global education is tackling in school.

In view of all of these, the researchers deem it proper to determine the extent global education is being promoted in Social Studies, and consequently, to establish its relationship, if there is any, to the students’ acquisition of global perspectives.

Promotion of Global Education in Social Studies

Global education, according to NCSS (2005), has as its main goal to “develop in youth the knowledge, skills, and attitudes needed to live effectively in a world possessing limited natural resources and characterized by ethnic diversity, cultural pluralism, and increasing interdependence.” It is based on the belief that due to increasing technology, worldwide environmental and political concerns, and the emergence of many international organizations and businesses,
the supremacy of national interests decline, and a universal, transnational culture come to prominence. While learning about where their languages, and cultures are certainly parts of global education, students must also gain awareness of how each countries interact with the world and create a new transnational society.

Gaudelli (2003) defined global education as a curriculum that seeks to prepare students to live in a progressively interconnected world where the study of human values, institutions, and behaviors are contextually examined through a pedagogical style that promotes critical engagement of complex, diverse information toward socially meaningful action. In this regard, the first objective of the study concerns the extent global education is promoted in Social Studies classrooms. Results of such inquiry are presented in the following table.

Table 1 shows the essential components of a global education. Interdependence among nations is one of the topics promoting global education. In general, teaching students interdependence among nations is observed in Social Studies classrooms as can be gleaned from an assessment rating of 3.81. Social Studies serves as a venue for the students to learn the need for countries to work together in order to maintain world peace and keep their economies in a healthy condition. The students are taught that world peace can be attained if disputing countries will be willing to sit down and have a meaningful dialogue where disagreements can be threshed out and given lasting solution. In the subject, international agencies like the United Nations are identified to facilitate such dialogues. Furthermore, students learned that any country can benefit from engaging in international trades with other countries inasmuch as these trades create jobs and generate profits among local industries.

In a globalized world, according to Malaya and Mendoza-Oblena (2010), nation-states are aptly described as independent within their respective borders but interdependent outside. The benefits of interaction and cooperation with other countries are generally beyond dispute. The same view was held by Carano (2013) when he stated that upon entering the twenty-first century; the world is becoming increasingly interconnected creating a need for a global education. Global education is a movement whose supporters advocate an education reflecting the push towards globalization by providing students with information necessary to live and thrive in an increasingly interconnected world system. Interdependence among nations is the need for countries to stay connected with one another in order that world peace and prosperity are maintained.

Global education has become an area of urgent need in the curriculum of all nations as technological advances and population shifts have changed the nature of the modern world. While many definitions of global education exist, Poole (2014) observed that most global education researchers would agree that the primary purpose of global education is to develop within students the skills and dispositions...
necessary to live and work successfully in a globally-interconnected world. Furthermore, Merryfield (2012) stated that everybody is all linked to people around the world, through economics, politics, culture, the environment, and technology; and that everybody's actions may have international effects.

Meanwhile, no other time in the history of mankind that problems confronting the world is as complex as it is now. It follows that promotion of global education will not be complete without the discussion of its second component—world problems. Opening the eyes of the students to world problems in Social Studies is observed as can be deduced from an assessment rating of 3.82 (see Table 1). Students are taught to empathize for others' misfortunes and be responsible enough to be actively involved in finding solutions to world problems. They learn that, because of globalization, problems of other countries can become the problem of the country, such as epidemics like AIDS and ebola virus, terrorism, human trafficking, and racism, to name a few. No country can evade these problems because of the fast and modern transportation that makes it easy for people to travel from one country to another. Here, the students get the chance to fully understand the extent of the problems and are encouraged to assume responsibility to do everything possible to get people and governments to work on a solution.

World problems are difficulties and dilemmas the world is facing that basically infringe on basic rights of people and endanger lives and properties of different nations. Pike and Selby (2000) suggested the inclusion of major world problems and their solutions in global education. They are inequality/equality, injustice/justice, conflict/peace, environmental damage/care, and alienation/participation. Awareness on these problems encourage students to contribute to their solutions.

With an assessment rating of 4.02, promotion of global education in Social Studies in terms of environmental concerns (3rd component) is observed. This results indicates that awareness on environmental sustainability is a concern that Social Studies inculcates to students. The teachers taught them to take personal responsibility of taking good care of the environment and contribute to its conservation and further development. Environmental concerns are problems created by man's wanton disregard of environment and ecological system that create natural calamities and disasters. Thus, the students are made aware that unless people learn to act against destruction of the environment, phenomena such as global warming, el niño/la niña, red tide, and storm surge will continue to haunt people.

Global citizenship, as the last component of global education, defines persons who place their identity to a planetary human community that is interdependent and whole. In Social Studies classrooms, promotion of global education in terms of inculcating global citizenship among students is observed as indicated by an assessment rating of 3.97. In this regard, the students are able to identify themselves as citizens of the world who are caring and are responsible for the welfare of others that goes beyond national borders. They learn that to be a global citizen, they have to fully utilize the latest technology to interact with other people. Modern communication makes it easy for people located in different parts of the globe to get interconnected. Students are taught to be tolerant and respectful of human diversity—respect for different views and perspectives for as long as they are not violating the rights of others.

In this regard, Myers (2006) suggested three primary themes that should be considered in school curricula for a global citizenship education. The first one is international human rights. He contends that this should be the foundation for learning about globalization. The second theme is the reconciliation of the universal and the local. This topic recognizes a global interdependence and focuses on the
complex relationships between local and global events. The final theme is political action beyond the nation-state. The goal of this dimension is to explore ways that globalization is changing politics and how the individual can work towards having an impact in improving the world, especially regarding issues that his or her government and other organizations are ignoring.

The goal of Social Studies education has long been committed to preparing citizens for participation in a democratic society. According to a position statement prepared by the NCSS Task Force on Revitalizing Citizenship Education (NCSS, 2001), citizenship education is as important today as at any other time in history. Citizens in the twenty-first century must be prepared to deal with rapid change, complex local, national, and global issues, cultural and religious conflicts, and the increasing interdependence of nations in a global economy. The field of Social Studies is rooted primarily in the academic disciplines of history, geography, civics, political science, and economics. Over the course of a century, Social Studies educators have adapted and responded to political, social, and economic changes. They inherit unique challenges in today’s increasingly globalized world. In this context, it becomes a necessity that global education be a part of Social Studies curriculum.

**Students’ Acquisition of Global Perspectives in Social Studies**

Global perspectives, according to Engberg and Fox (2011), refers to the acquisition of knowledge, attitudes, and skills important to intercultural communication and the development of more complex processes, identities, and interpersonal development. It is a way of understanding the world based on a number of facets including multiple viewpoints, knowledge of global dynamics, interconnected nature of things, realities of human choice, and the implications of those choices.

Poole and Russel (2013) explained that the first step to promoting global perspectives in the classroom is to ensure that the teachers develop their own global perspectives. According to Turner, Russel and Waters (2012), it is crucial that teachers not only value Social Studies as a discipline, but also value the promotion of global perspectives in their students. Furthermore, Miliziano (2009) suggested that education is by far the most hopeful and promising endeavour of the human race. There is nothing more critical than understanding what teachers do every day as they prepare generations to become knowledgeable, empowered, empathetic, compassionate, and peace-loving citizens of the world.

Within the above-mentioned premises, the study focused its effort to determine how the students acquire global perspectives in Social Studies. Table 2 shows level of agreement of student on their acquisition of global perspective in the course.

Legend: 4.50 – 5.00, Strongly Agree (SA); 3.50 – 4.49, Agree (A); 2.50 – 3.49, Neither Agree nor Disagree (N); 1.50 – 2.49, Disagree (D); 1.00 – 1.49, Strongly Disagree (SD)

Table 2 shows the students’ agreement on their acquisition of global perspectives in terms of cognitive domain. Braskamp et al. (2013) explained that the cognitive domain that the students acquire relates to the knowledge and understandings one has about the world, what knowledge one judges to be important, and the way in which knowledge is gained. The said domain focuses on the way participants approach thinking & knowing and on the actual
knowledge that participants have acquired about the world. In general, the students agree that they acquire the cognitive domain of global perspectives in Social Studies as can be gauged from a general assessment rating of 4.02. This result implies that students' acquisition of knowledge in global perspectives enable them to develop their ability to work effectively in a global context. They are made to understand the different views of different people of diverse nationalities in different global issues and concerns that explain their expected reactions and apprehensions on these matters. They get to know various cultures of the world that enlighten them of their values, beliefs, symbols, and language. And when making conclusions out of studying global disputes, the students take into account different points of view enabling them to offer judicious solutions.

Apparently, the intrapersonal domain, according to Braskamp et al. (2013), focuses on one's personal values and self-image. It measures the participants' knowledge about themselves and their unique identity & purpose in life. It also measures participants' level of respect for and acceptance of cultural differences.

Taken as a whole, the students are able to acquire the intrapersonal domain of global perspectives in Social Studies as can be deduced from a general assessment rating of 4.22. This result implies that global perspectives enable the students to fully know oneself paving the way in developing self-confidence and tolerant of differing points of views. The students acquire the inner strength to hold onto their principles and philosophy in life in their day-to-day interaction with other people. They are sure of their values, beliefs, and identity in the midst of diverse religious, political, and cultural perspectives while respecting the points of view of others.

Finally, Braskamp et al. (2013) defined the interpersonal domain as measures of one's ability and comfort in relating to others, and acceptance of cultural differences. It measures participants' feelings of concern for members of other cultural groups, and the participants' degree of interaction with members of other cultural groups.

In general, Social Studies enable the students to acquire the interpersonal domain of global perspectives as can be seen from a general assessment rating of 4.16. Students were able to develop their civic-mindedness, that is, to serve and work for the general welfare of society. They get to appreciate interacting with people of different cultures and be accommodating of people who live differently. They also learn that it is a good idea of working with other nationalities in a global workforce. They look for the time in the future they can travel abroad, work or live there.

In relation to this, Social Studies, according to Avery (2004), is the primary subject through which young people develop their civic identity. The National Council for the Social Studies (NCSS, 2010) defined Social Studies as "the integrated study of the Social Sciences and Humanities to promote civic competence." Civic competence requires the knowledge and dispositions embraced by global educators including a thorough understanding of world geography, national and international politics, and intercultural and interpersonal skills (Rapoport, 2012). The Organization for Economic Cooperation and Development [OECD] (2010) asserted that high levels of global perspectives are the key indicators of a nation's potential for economic success in the future. Students' learning is not simply an understanding of each world issue but an awareness of the interconnections among these issues.

**Relationship of Global Education & Global Perspectives**

The last concern of the study is to establish relationship, if there is any, between promotion of global education and students'
acquisition of global perspectives in their subject Social Studies. Results of analyses done are presented in the table below.

Table 3 shows that all analyses generated probability values which are all less than the level of significance equal to 0.05. In general, the promotion of global education in Social Studies is significantly related to the students’ acquisition of global perspectives. The results imply that the more global education is promoted such as increased discussions on world problems, issues and concerns in Social Studies, the more likely students develop their global perspectives which include developing the virtue of empathy, responsibility and civic mindedness making them global citizens beyond national boundaries and territories.

The importance of global education, according to Poole and Russell (2013), cannot be overstated in modern society. In order to be successful and live happily in the world, today’s young people must develop the skills, knowledge, and attitudes required to interact with people and countries around the globe.

To realize promotion of global education and global perspectives in Social Studies classrooms, the teachers should have sufficient preparation and training. Miliziano (2009) explained that understanding the experiences of teachers who elect to participate in globally oriented programs is vital in preparing Social Studies teachers. Teacher preparation and in-service training need to be responsive to the need to develop an emerging cadre of teachers who are becoming increasingly aware of the need to infuse global perspectives into the Social Studies curriculum. Professional standards have long called for Social Studies teaching for global citizenship. Furthermore, economic and political stakeholders call for

Social Studies curriculum to include global perspectives, and prospective teachers and pre-service teachers demonstrate increasing global mindedness and awareness of the need to provide their students with knowledge about the world from a global perspective.

Recommendations

In the light of the aforecited findings and conclusions of the study, the researchers hereby recommend the following:

Global education should be given adequate time for discussion in Social Studies. The students may engage in different global education-related activities such as newspaper reading on world issues and conflicts; internet researches on history, culture and tradition of different people; and conducting studies on societal problems. Make the lesson more attractive with the use of modern education technologies like slides presentation in depicting the colorful cultures and traditions of the world, videos that show the realities of events happening in different countries, and even movies that dwell on the plights of the underprivileged and deprived people of different countries.

To be successful in this world, today's young people must develop the skills, knowledge, and attitudes required to interact with people of different nationalities. However, the first step in promoting global perspectives in the classroom is to ensure that the teachers have developed their own global perspectives. They could embark on personal readings of books, journals and internet articles that deliberate on the said topic. They may also attend seminars and public talks on these matters.

Furthermore, students may develop global perspectives by allowing them to experience actual exposure in the economically marginalized and informal settlers’ ways of living; conducting surveys on the points of views of the different sectors on issues of national and international concerns; performing debates tackling controversial topics that divide the society; and conducting fora with invited panelists where they can ask questions and clarifications on issues that headline the newspapers. Encourage the students to get actively involved in civic and socially relevant activities. Essays and verbal
reasoning in tests further hone the students’ global perspectives. Moreover, requesting students to provide solutions to world problems will surely enhance their skills in problem solving and critical thinking.
